Create logos for business or personal use. You can create logos,

banners and other graphics. Use the professional tools to create logos and other graphics. Double-blind, placebo-controlled study of high doses of alendronate in the treatment of Paget's disease of bone. Few clinical studies have examined the long-term effects of alendronate in Paget's disease. We examined the safety and efficacy of alendronate in patients with radiographically confirmed Paget's disease. In this multicenter, randomized, double-blind study, men and postmenopausal women with Paget's disease received either the oral weekly dose of alendronate (10 mg, 30 mg, or 70 mg) or a matching placebo. Treatment was administered for 6 months. Assessments of bone turnover markers, bone mineral density (BMD), and bone pain, including a visual analogue scale score, were performed at baseline and at months 1, 3, and 6. Radiographic changes were assessed using the Periot
